### FRONTEND DEVELOPMENT WINTERSEMESTER 2020

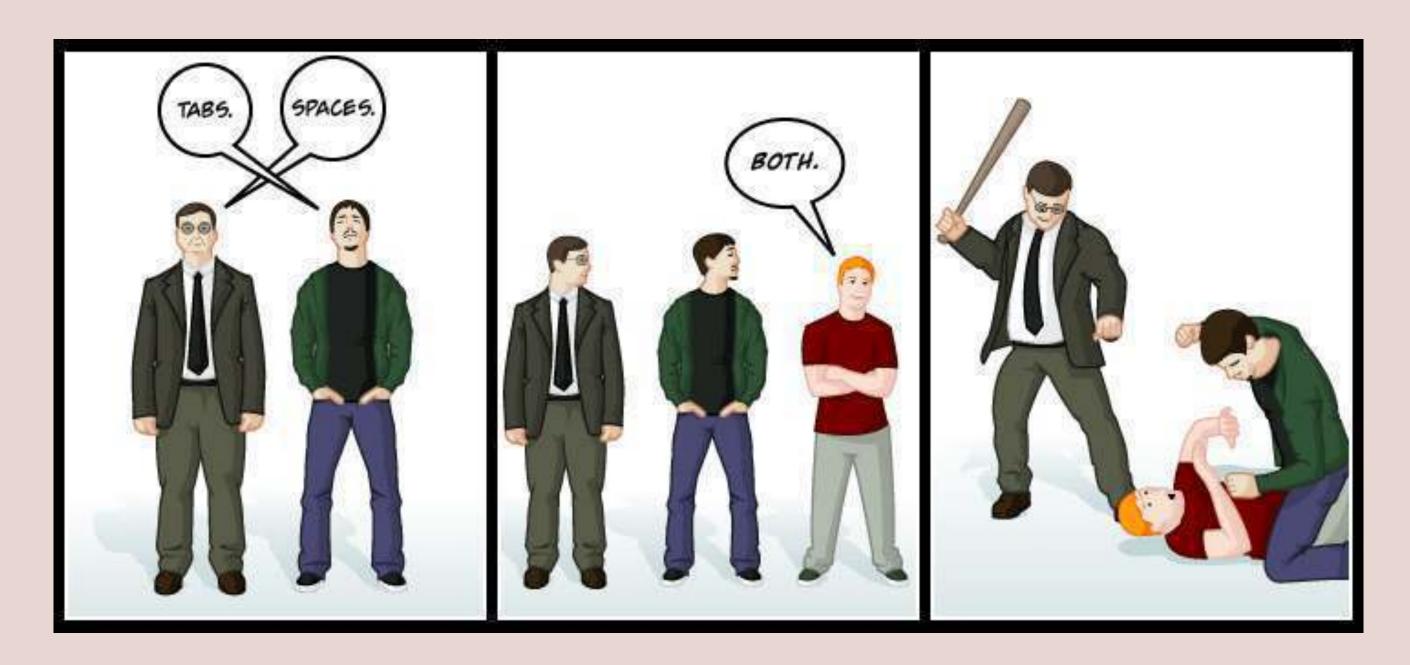

### LINTING 1

"Linting is the automated checking of your source code for programmatic and stylistic errors"

https://www.perforce.com/blog/qac/what-lint-code-and-whylinting-important

### LINTING 5

<sup>&</sup>lt;sup>5</sup> source https://dev.to/\_shadz/tabs-vs-space-4915

### LINTING

- » Prevent programming errors
  earlier
  - >> tells problematic
     sections of the code
     earlier
- » Enforce code consistency in projects

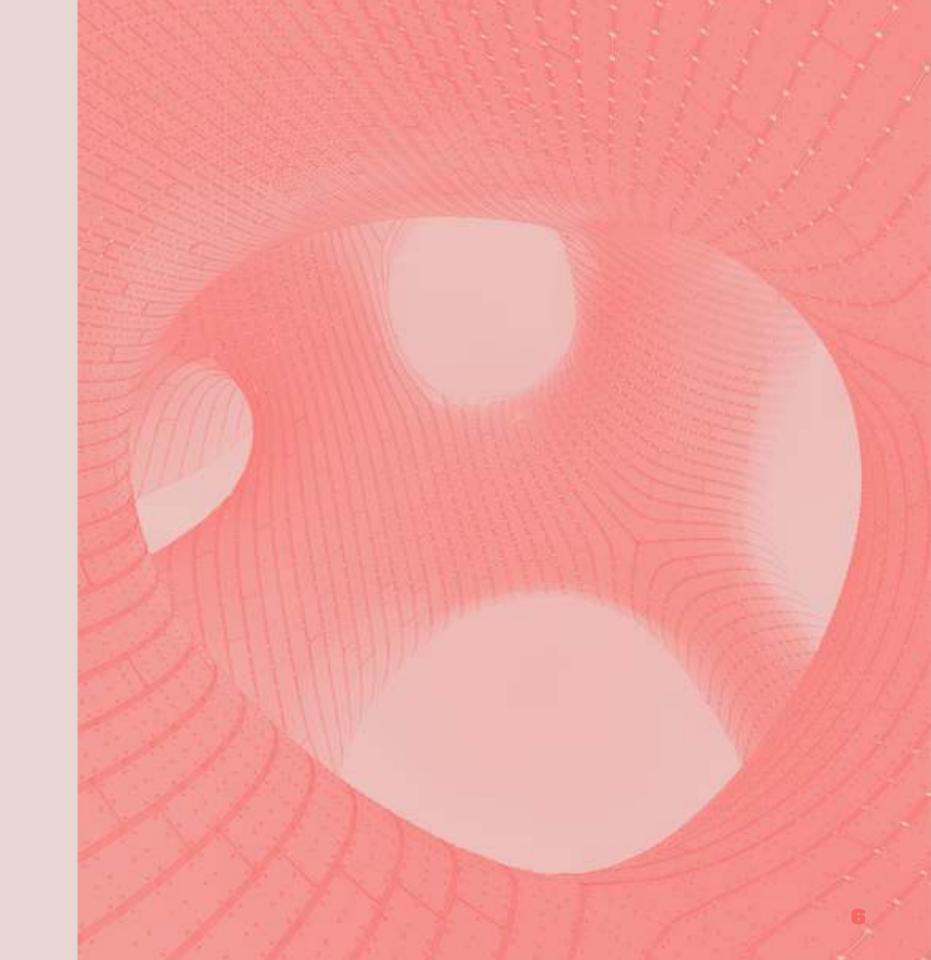

### LINTING IN JS

- » spaces vs. tabs (see:
   https://www.youtube.com/
   watch?v=SsoOG6ZeyUI)
- » naming (camelCase vs.
  snake\_case)
- » prevent == vs === errors
- » using single vs double
  quotes
- » code formatting

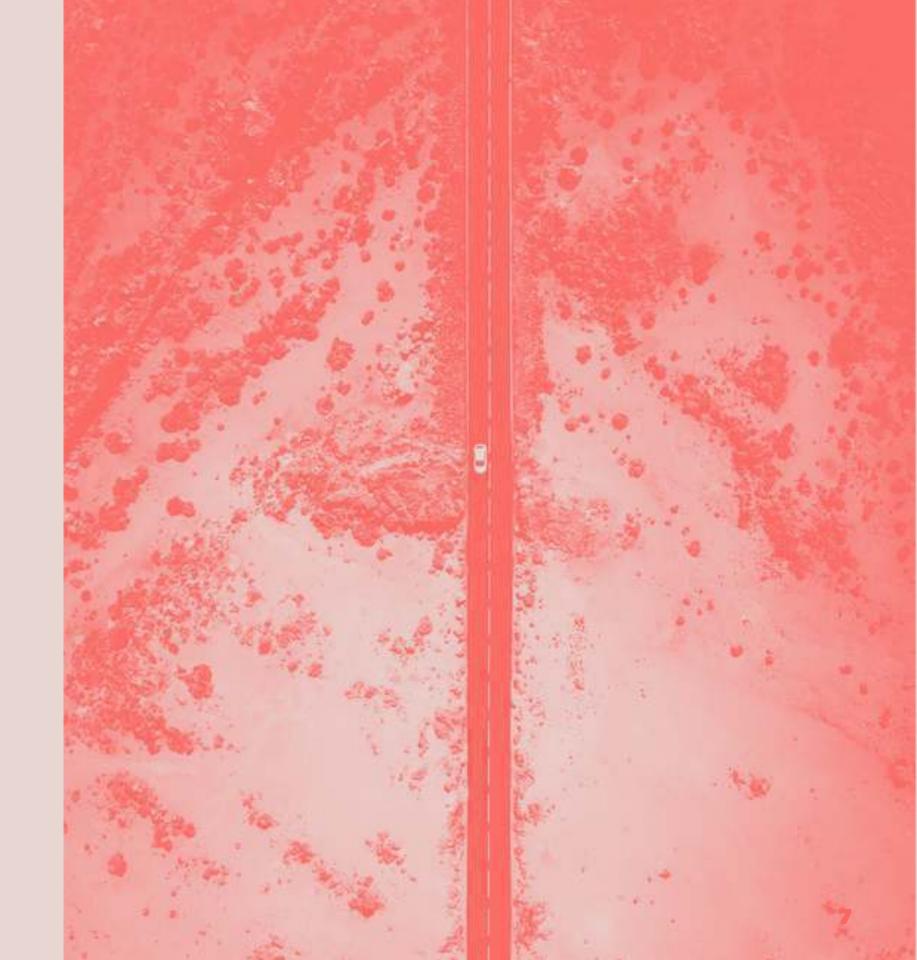

**>>** . . .

### LINTING TOOLS

- » various tools exist to
  validate code consistency
  - » EditorConfig
  - » eslint (defacto standard)
  - » prettier (more code
    formatter)

#### **EDITORGONFIG**

"EditorConfig helps maintain consistent coding styles for multiple developers working on the same project across various editors and IDEs."

```
# Unix-style newlines with a newline ending every file
[*.{js,py}]
indent_style = space
indent_size = 4
end_of_line = lf
insert_final_newline = true
```

### ESLINIT

- » standard tool for linting
- » easy to extend
- » autofix option
- » can be configured <sup>2</sup>

<sup>&</sup>lt;sup>2</sup> and is configured in every project differently

## ESLINT PRESETS

- » presets bundle rule-sets
  together
- » well known presets are:
  - » eslint-config-airbnb
  - » eslint-config-standard
  - » eslint-config-google
  - » ...

## ESLINT INSTALL ESLINT 3

```
npx eslint --init # wizard opens (answer questions)
npx eslint . # lints all the files
npx eslint . --fix # lints all the files and fixes most errors
```

<sup>&</sup>lt;sup>3</sup> see https://eslint.org/docs/user-guide/getting-started for up to date information

## ESLINT ADD ESLINT TO PACKAGE.JSON

```
// other contents of package.json
 "scripts": {
    "start": "http-server .",
    "lint": "npx eslint ."
// npm run lint
// npm run lint -- --fix
// are needed so npm passes --fix to eslint
```

## ESLINT RULE CONFIGURATION

```
// .eslintrc.js

module.exports = {
  rules: {
    "no-await-in-loop": "off", // Possible values are "off", "warn", "error"
  }
}
```

## ESLINT DISABLE RULES 4

» sometimes disabling rules is ok

```
// eslint-disable-next-line max-len
const anExtremelyLongLine = "....."

const anExtremelyLongLine = "....." // eslint-disable-line max-len
```

<sup>4</sup> see https://eslint.org/docs/user-guide/configuring#disabling-rules-with-inline-comments for all options

## VERIFYING LINTING RULES

- » verify linting continuously
  - » on a CI server (eg.
    github actions)
  - » on a git hook (eg. precommit, pre-push hook)

### GIT HOOKS

- » are executed when something happens
- » available hooks are

```
pre-commit // <- we'll be using this
pre-push
post-commit
post-push
//...</pre>
```

## PRE-COMMIT HOOK WITH HUSKY 6

- » Husky adds git hooks during installation
- » in package.json add the following:

6 see https://www.npmjs.com/package/husky

## ESLINT AUTOFIX STAGED FILES BEFORE COMMIT 15

- » lint-staged only lints files which have changed
  - » adds autofix possibility to githook
  - » installation npx mrm lint-staged

<sup>&</sup>lt;sup>15</sup> docs https://github.com/okonet/lint-staged

# 

### TASK (20 MINUTES)

- » Go into your homework group
- » Add eslint and pre-commit hook to your homework
- » Fix all errors in your code
- » I'll try to join each room and help when I'm needed

## 

### JS BUNDLING

"A bundler compiles small pieces of code into something larger and more complex, such as a library or application <sup>7</sup>"

<sup>7</sup> source https://rollupjs.org/guide/en/

### WHY MODULES 1

- » Maintainability
- » Namespacing
- » Reusability

https://www.perforce.com/blog/qac/what-lint-code-and-whylinting-important

## JS BUNDLING WHY BUNDLING

- » JS apps are a bundle of
  modules 8
- » older browsers might not understand JS modules
- » older node version might
  not understand JS modules

<sup>&</sup>lt;sup>8</sup> see module slides

### JS BUNDLING TOOLS

- » Tools which resolve modules
  locally and bundle them
  together into a bigger
  bundle
- » Bundling tools are:
  - » Rollup
  - » Parcel
  - » Webpack

## JS BUNDLING TOOLS WITH ROLLUP

```
// rollup.config.js
export default {
  input: "index.js",
  output: [
    { file: "./build/index.bundle.js", format: "iife" },
 ],
// # add build directory to gitignore
// echo ./build > .gitignore
// # build the app
// npx rollup -c
```

### TREE-SHAKING

- » when adding a module
  everything gets added to
  bundle
  - » large libraries could increase the bundle unnecessarily
- » bundlers which support tree
  shaking remove unused parts

## TREE-SHAKING EXAMPLE

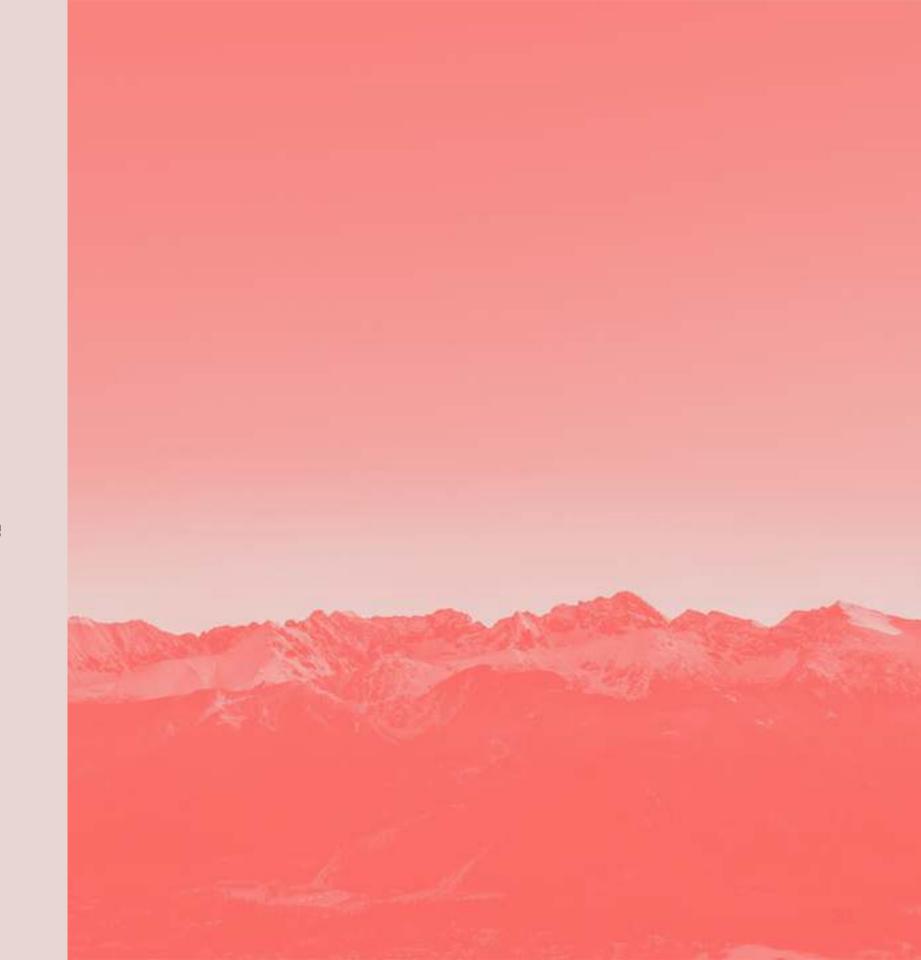

```
// a.js
export const aFunction = () => { console.log('a') }
export const bFunction = () => { console.log('a') }
// b.js
import {aFunction} from './a.js'
// Result: b.bundle.js
const aFunction = () => { console.log('test'); };
aFunction();
```

FHS CONTRACTOR OF THE CONTRACT

## JS BUNDLING TOOLS WITH ROLLUP (NO CONFIG REQUIRED)

npx rollup ./index.js -d build/

# bFunction won't be part of the bundle

### MINIFICATION 9

"Minification refers to the process of removing unnecessary or redundant data without affecting how the resource is processed by the browser."

<sup>9</sup> source https://developers.google.com/speed/docs/insights/
MinifyResources#:~:text=Minification%20refers%20to%20the%2
Oprocess,specific%20optimizations%20to%20learn%20more.

### MINIFICATION

- » decrease bundle/download
  size by removing
  - » comments
  - » formatting
  - » unused code
  - » shorten variable/
    function names
  - » ...
- » get better google page

### MINIFICATION

- » minification can be done
  to:
  - » js
  - » html
  - >> CSS
  - » ...

## MINIFICATION WITH TERSER PLUGIN

» npm i rollup-plugin-terser

#### SOURCEMAPS

- » debugging minified code is no fun
- » Sourcemaps way to revert minimization of code
- » are defined as a special comment at the end of the file
  - » external
  - » //# sourceMappingURL=http://example.com/path/to/
    your/sourcemap.map

#### **CODE SPLITTING**

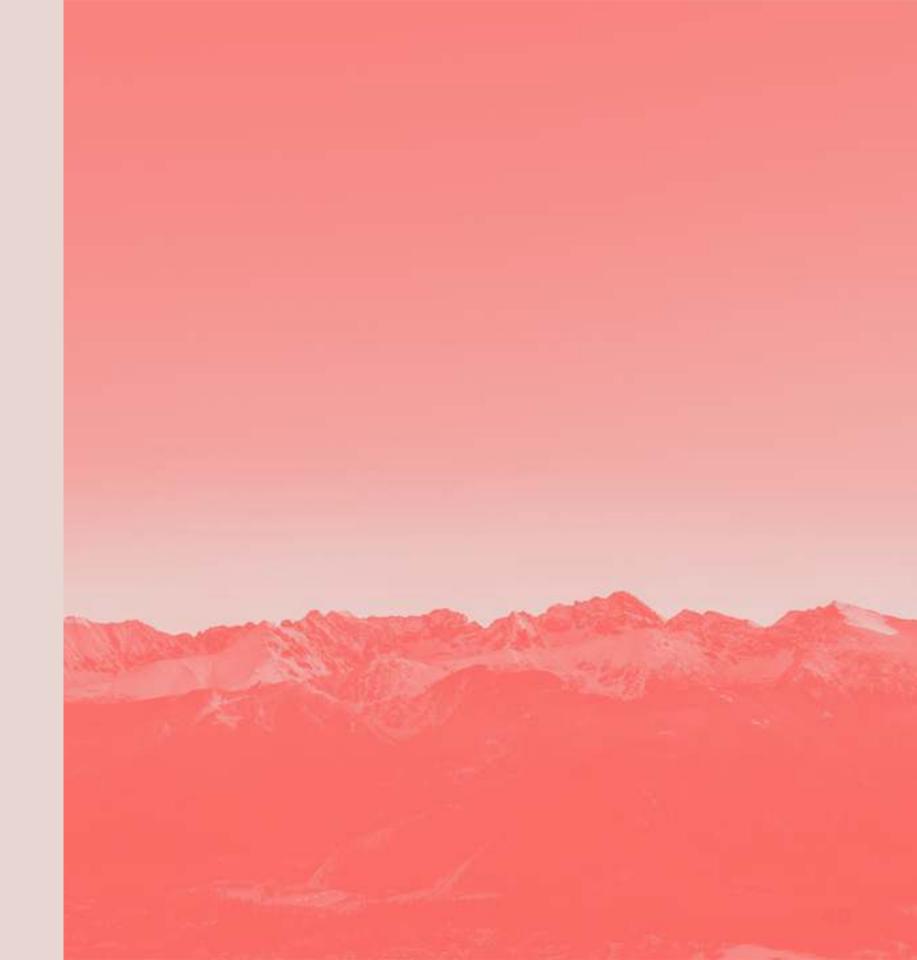

- » split your JS bundle into multiple smaller bundles
  - » eg. create a vendor bundle (with libraries)
  - » this file can be cached by the browser
  - » recurring users don't need to download libs
    twice

FHS The state of t

# USING ESNEXT FEATURES IN LEGACY BROWSER

#### TRANSPILING

- » source to source translator
- » takes code and converts it
   to code of a different
   language
  - » eg. convert ESNext for
    old browsers

## TRANSPILING WITH BABEL & ROLLUP

- » babel is a transpiler 10
  - » it converts new syntax for the use in old browsers

```
// eg. es6 arrow functions
const myFunction = () => {}

// will become
const myFunction = function myFunction () {}
```

10 see babel repl

## TRANSPILING WITH BABEL & ROLLUP 11

```
# install babel transpiler
npm install --save-dev @babel/core @babel/preset-env
```

```
# install babel plugin for rollup
npm install --save-dev @rollup/plugin-babel
```

<sup>&</sup>lt;sup>11</sup> installation instructions for other bundlers https://babeljs.io/en/setup

## TRANSPILING CONFIGURE BABEL & ROLLUP

```
// rollup.config.js
import { terser } from "rollup-plugin-terser";
import babel from '@rollup/plugin-babel';
export default {
  input: "index.js",
  plugins: [
     babel({ presets: [['@babel/env', {}]] }),
//1)^^^^
//2)
                             \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge \wedge
//1) add the babel plugin
//2) define the @babel/env
    // ... other plugins
```

## TRANSPILING @BABEL/PRESET-ENV

- » a preset is a collection of transformations
  - » eg. arrow function to function expression
- » preset-env is smart enough to only add transforms
  which are required
  - » can be configured via .browserslistrc
- // .browserlistrc
- > 5% in AT

### 

#### POLYFILLS 13

"New language features may include not only syntax constructs and operators, but also built-in functions."

<sup>13</sup> source https://javascript.info/polyfills

#### POLYFILLS

```
» Math.trunc removes the decimal part of a number
  \gg Math.trunc(1.23) === 1
  » older browsers might not implement Math.trunc
» Polyfills patch the browser with new APIs
Math.trunc = function trunc(it) {
  return (it > 0 ? floor : ceil)(it);
```

## POLYFILLS BUNDLE WITH OUR APPLICATION

» Install dependencies

```
# dependencies needed for bundling polyfills
npm i @rollup/plugin-node-resolve @rollup/plugin-commonjs --save-dev
# install polyfills
npm i core-js@3 --save
```

## POLYFILLS CONFIGURE ROLLUP 14

```
// rollup.config.js
import { terser } from "rollup-plugin-terser";
import babel from '@rollup/plugin-babel';
import resolve from '@rollup/plugin-node-resolve';
import commonjs from '@rollup/plugin-commonjs';
export default {
  input: "index.js",
  plugins: [
    babel({
      presets: [['@babel/env', {
        babelHelpers: 'bundled', // add require statements for polyfills
        exclude: 'node_modules/**',
        presets: [
          ['@babel/env', { "useBuiltIns": "usage", corejs: { version: 3 } }]
     }]]
    }),
    commonjs(), // signalize rollup that it should bundle commonjs modules
    resolve(), // inline libraries from node_modules
  // ...
```

<sup>14</sup> complete configuration https://gist.github.com/webpapaya/45c5aae75bbe4e8eb72bc19c33e080bf

## 

#### TASK

- » Go into your homework group
  - » on a dedicated branch
- » Add rollup and build your app into one file
  - » add minification
  - » add babel
  - » play around with different .browserlistro configs and see the difference in bundle size

#### HOMEWORK

- » Finish the quiz
- » when not already done
  during todays lecture
  - » finish linting your
    application
  - » I'll test via npm run
    lint
  - » any error will result in
    -2 points

#### FEEDBACK

- » Questions: tmayrhofer.lba@fh-salzburg.ac.at
